

UCY-I210

Industrial Grade 4G Wireless Router

User Manual

- Based on High Performance 32bit MIPS processor and Industrial Communication Module
- Support VPN Client
- Wide Voltage Input Design 6 ~ 36V
- Industrial Casing Design, Quick Installation & Quick Use
- Rich Industrial Application Interface, Built-in ESD Protection
- Support 4G Cat1 or 4G Cat4 modem Solution.

Product Description

In the world of the internet of things, everything is interconnected. The demand for intelligent communication will become higher and higher, especially in the field of intelligent industrial control. The UCY I210 4G industrial router is a new generation of 4G wireless router launched by Shenzhen Jiawen Technology Co., Ltd. for the industrial field. The device provides fast Internet access with the explosive growth of 4G cellular data network and a variety of wired high-speed broadband access services.

In addition, UCY I210 provides single 10/100Mbps RJ45 LAN network port, a set of industrial phoenix terminals (serial port RS232 or RS485), and a drawer SIM/UIM card slot. It can have the serial port, Ethernet port, and WIFI connected and working at the same time, providing pass-through data transmission.

UCY I210 supports remote management via the cloud management platform. It has a simple graphical interface, is convenient and quick to use. It lets you know the current status of equipment anytime, anywhere, widely used in M2M industries and the Internet of Things, such as smart grid, smart transportation, smart home, finance, Mobile POS terminal, supply chain automation, industrial automation, intelligent building, fire protection, public safety, environmental protection, meteorology, digital medical treatment, telemetry, military, space exploration, agriculture, forestry, water, coal mine, petrochemical, and other fields.

Features

Ruggedized Industrial Design

UCY I210 is based on MTK 32-bit MIPS chipset solution in the product design. It has built in 64MB system memory and supports WIFI 2.4GHz 802.11n protocol and provides a maximum rate of up to 150Mbps (Single Antenna). In addition, the product adopts the metal casing to provide industrial isolation protection, which is especially suitable for industrial control field applications. The wide voltage input design is 6~36VDC, the standard 12VDC power input, and the built-in power reverse protection.

Stability and Robustness

UCY I210 adopts dual watchdog design to ensure system stability and support long-term stable operation. Cellular communication adopts a complete anti-drop mechanism to ensure that data communication terminals are always online. At the same time, it provides comprehensive interface protection functions and supports built-in 1.5 KV electromagnetic isolation protection, SIM/USIM interface built-in 1.5KV ESD protection, power interface built-in reverse protection and overvoltage protection, antenna interface lightning protection (optional).

User Friendliness

UCY I210 provides standard RS232/RS485, Ethernet and WIFI interfaces, which can directly connect serial devices, Ethernet devices and WIFI devices. The standard wired WAN port supports PPPoE protocol and can be directly connected to ADSL equipment. The device can perform as an intelligent data terminal, which can enter the data transmission state when it is powered on. It supports a powerful cloud management platform, which is convenient for multi-device management (optional). It is easy to use and flexible. It supports multiple working modes and is convenient for system configuration. and maintenance (including local, remote web, and cloud platform management).

Phoenix Terminal Block Pin Definition

Pin	Definition	Description
RXD/B485B	Serial Port	RS232 or RS485 (Depend on Model)
TXD/485A	Serial Port	RS232 or RS485 (Depend on Model)
GND	Data Ground	RS232 has common ground, RS485 does not need to be connected
VIN-	Power Ground	Power Ground
VIN+	Power Supply	DC 6~36V Input

Quick Start

Mounting Accessories

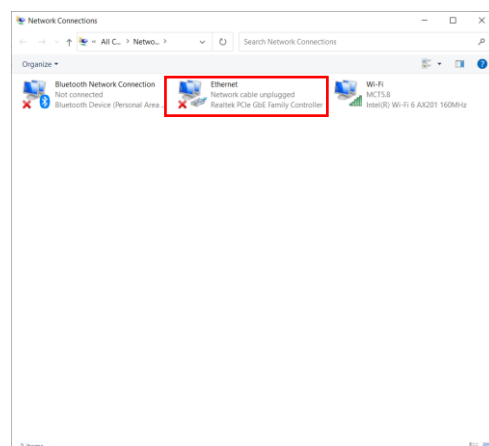

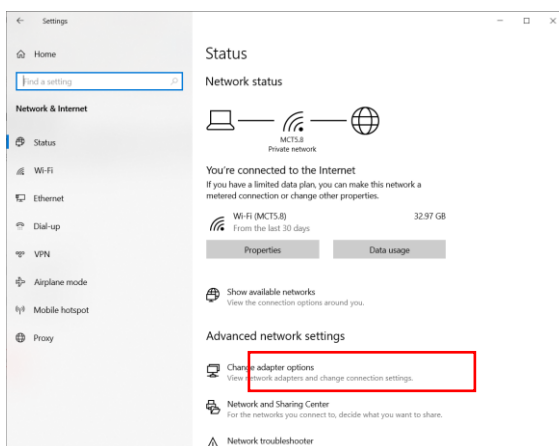

Put the WIFI antenna, 4G antenna, and SIM card into the designated position according to the interface, connect to the 6-36V DC power supply, observe the indicator light, after the sys light flashes, the router starts normally.

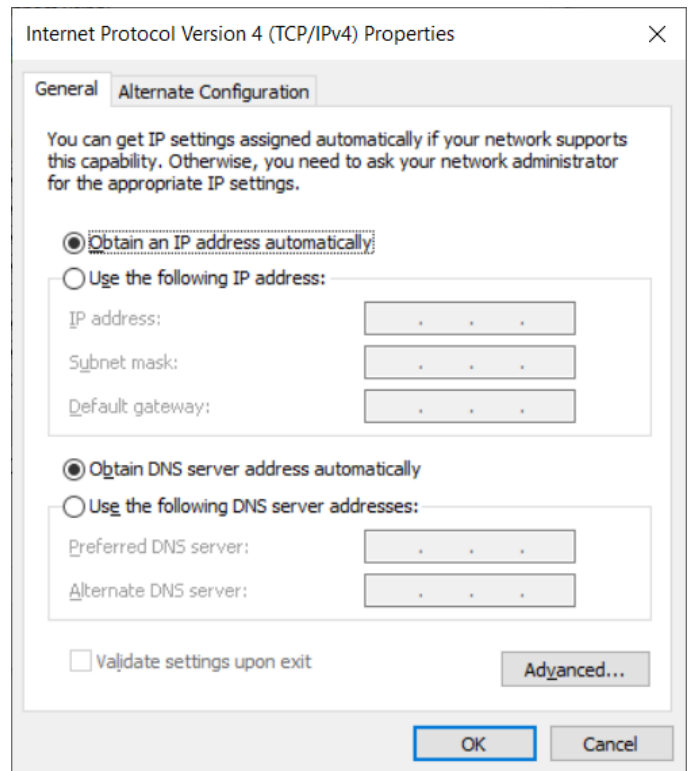

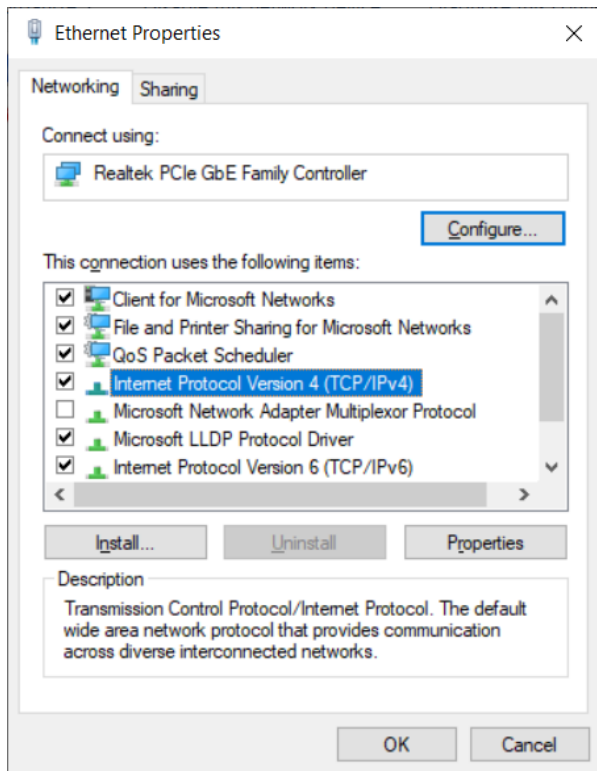

Note: Please do not remove or insert the SIM card with power on, otherwise the SIM card may be damaged.

Connect to the Internet

Correctly set your computer network configuration, now take win10 operating system as an example, use it to open "Settings\Network & Internet\Change Adapter Options" in Control Panel. Double-click the "Ethernet" connection icon.

In the pop-up dialog box, click "Properties", select "Internet Protocol Version 4 (TCP/IPv4)", and then click the "Properties" button; select "Obtain an IP address automatically". After clicking OK to save, the computer will automatically obtain the IP address assigned by the router.

Login to the router

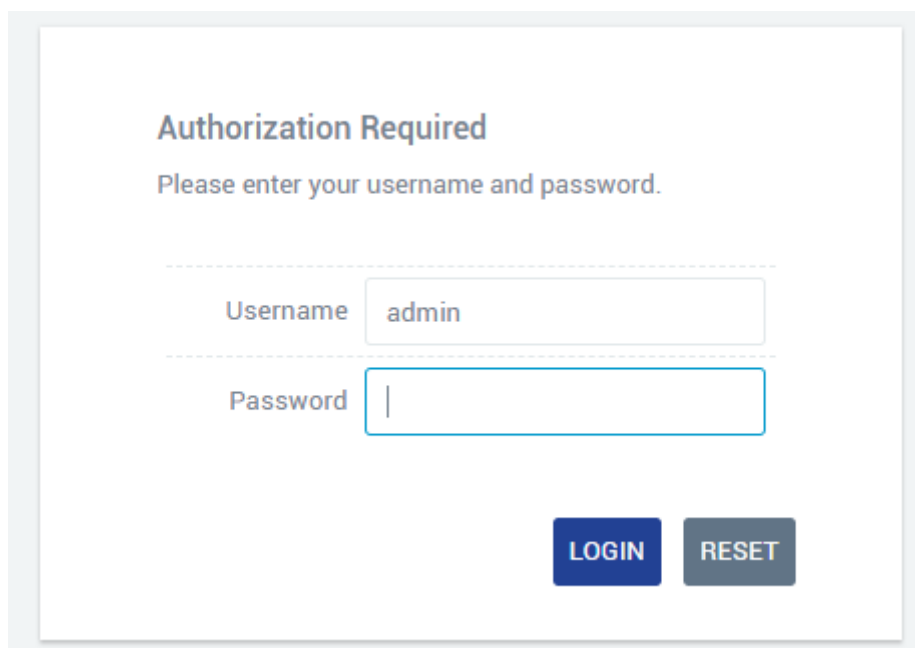

WebUI Login

Open a web browser, key in `http://192.168.99.1` in the address bar and press Enter;

Default Username: admin

Default Password: admin

It is recommended to use Google Chrome or Mozilla Firefox browser.

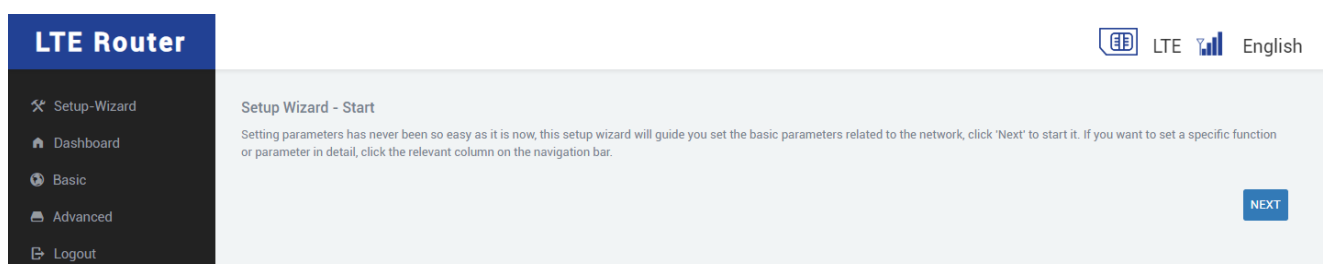

The image shows a web browser window displaying the 'Authorization Required' login page. The page has a light gray background. At the top, the text 'Authorization Required' is in a bold, dark blue font, followed by 'Please enter your username and password.' in a smaller, gray font. Below this, there are two input fields. The first is labeled 'Username' and contains the text 'admin'. The second is labeled 'Password' and is empty, with a vertical cursor visible. At the bottom right of the form, there are two buttons: a blue 'LOGIN' button and a gray 'RESET' button.

Note: For the first time, after the login page will see the setup wizard page. You can configure the router directly according to the setup wizard.

Setup Wizard

For the first time, after the login page will see the setup wizard page. You can configure the router directly according to the setup wizard.

The image shows the 'LTE Router' web interface. On the left is a dark blue sidebar with the title 'LTE Router' in white. Below the title are five menu items: 'Setup-Wizard' (with a wrench icon), 'Dashboard' (with a house icon), 'Basic' (with a gear icon), 'Advanced' (with a document icon), and 'Logout' (with a door icon). The main content area has a light gray background. At the top right, there are three status indicators: a signal strength icon, 'LTE', and a language icon with 'English'. The main heading is 'Setup Wizard - Start'. Below it, a paragraph reads: 'Setting parameters has never been so easy as it is now, this setup wizard will guide you set the basic parameters related to the network, click 'Next' to start it. If you want to set a specific function or parameter in detail, click the relevant column on the navigation bar.' At the bottom right of the main content area, there is a blue 'NEXT' button.

Click Next to enter Quick Configuration - Mobile Network APN Settings, this page can set the APN.

Click Next to enter the Quick Configuration - Wired WAN Configuration interface.

Configure WAN - description of the connection method:

WAN Setting	Description	How to Set
DHCP	When connected. Automatically obtain the IP address and subnet mask assigned by the server	No configuration
PPPoE	The router is connected to the optical fiber/Cable, and the account and password provided by the operator are used to dial up the Internet	Setup access username and password
STATIC	Manually assign IP address and subnet mask	Setup IP address, Subnet Mask, Gateway, and DNS.

Click Next to enter the Quick Configuration - Local Address Configuration interface, where you can modify the local IP address and subnet mask.

Cellular – Band Lock

In this section, you can lock the cellular network module frequency band. After locking the frequency band, restart the router is required. The router will automatically dial and connect to the network of the selected frequency band.

The screenshot shows the 'LTE Router' web interface. On the left is a dark sidebar with a menu: Setup-Wizard, Dashboard, Basic, Cellular (highlighted), Wired, Wi-Fi, DHCP Server, Advanced, and Logout. The top right corner shows 'LTE', a signal strength icon, and 'English'. The main content area has a breadcrumb trail: Cellular Information > Cellular Setting > **Band Lock** > Network Selection. Below the breadcrumb is the title 'Lock The Band'. The form contains: a 'Lock' dropdown menu set to 'ALL BANDS'; a 'Lock Cell Switch' checkbox which is unchecked; a 'Current Lock (E)arfcn' text box containing '38400'; and a 'Current Lock PCI' text box containing '362'. A blue 'SUBMIT' button is at the bottom right.

Cellular – Network Selection

In this section, you can select the dialing method, such as Auto, GSM, WCDMA, LTE, etc.

The screenshot shows the 'LTE Router' web interface. The sidebar and top right corner are identical to the previous screenshot. The breadcrumb trail is: Cellular Information > Cellular Setting > Band Lock > **Network Selection**. Below the breadcrumb is the title 'Config The Selection of NetWork'. The form contains a 'Network Selection' dropdown menu set to 'Automatic'. A blue 'SUBMIT' button is at the bottom right.

Common Settings - Wired Network

The wired network can set the WAN port and LAN port of the router.

LAN

The screenshot shows the 'LAN Setting' page of an LTE Router. The left sidebar contains a menu with 'Setup-Wizard', 'Dashboard', 'Basic', 'Cellular', 'Wired' (selected), 'Wi-Fi', 'DHCP Server', 'Advanced', and 'Logout'. The main content area has tabs for 'LAN' and 'WAN'. Under 'LAN Setting', it says 'Configure the LAN Connection'. There are two input fields: 'IPv4 Address' with the value '192.168.99.1' and 'IPv4 Netmask' with the value '255.255.255.0'. A 'SAVE & APPLY' button is located at the bottom right.

WAN

The screenshot shows the 'WAN Setting' page of an LTE Router. The left sidebar is the same as the LAN page. The main content area has tabs for 'LAN' and 'WAN'. Under 'WAN Setting', it says 'Configure the WAN Connection'. There are three input fields: 'Protocols' with a dropdown menu showing 'DHCP', 'MTU', and 'Check Alive Host'. A note at the bottom states: 'Note: It is differently from Cellular network and WIFI repeater network.' A 'SAVE & APPLY' button is located at the bottom right.

Configure wired WAN network - basic settings parameter description:

WAN Setting	Description	How to Set
Protocols	You can choose different dial-up methods to access the Internet	Click the drop-down box to select

MTU	The maximum transmission unit is used to notify the other party of the maximum size of the data service unit that can be accepted.	Leave Blank by Default
Check Alive Host	Fill in the destination address of the Ping packet to keep the cellular network online	Fill in the IP that can be pinged

Configure wired WAN network - description of the connection methods (Protocols):

WAN Protocol Option	Description	How to Set
DHCP	When connected. Automatically obtain the IP address and subnet mask assigned by the server	No configuration
PPPoE	The router is connected to the optical fiber/Cable, and the account and password provided by the operator are used to dial up the Internet	Setup access username and password
STATIC	Manually assign IP address and subnet mask	Setup IP address, Subnet Mask, Gateway, and DNS.

Common Settings – Wireless

Wireless network can set WIFI name, encryption, channel and other common parameters. Also, WIFI can be setup as a WIFI relay for the router.

2.4GHz WIFI Setting

The screenshot shows the 'LTE Router' web interface. On the left is a dark sidebar with a menu: Setup-Wizard, Dashboard, Basic, Cellular, Wired, Wi-Fi (highlighted), DHCP Server, Advanced, and Logout. The main area is titled '2.4G Repeater' and 'Wi-Fi Setting'. Below the title is the instruction 'Configure the params of 2.4G wireless'. The form contains the following fields: SSID (text input with value 'LTE-2G-2605F0'), Hide ESSID (dropdown menu with 'Disable' selected), AuthMode (dropdown menu with 'WPA-PSK/WPA2-PSK Mixed Mode' selected), Key (password input with masked characters and a green lock icon), HT Mode (dropdown menu with '20/40 MHZ' selected), Country Region (dropdown menu with '0: Ch1~11' selected), and Channel (dropdown menu with 'Auto (Channel 0)' selected). A blue 'SUBMIT' button is located at the bottom right of the form.

Configure Wireless network (WIFI) - basic settings parameter description:

WIFI Setting	Description	How to Set
SSID	WIFI Name, WIFI SSID	You can fill in any name you like
Hide Name	Make SSID invisible to users	Click the drop-down box to select Disable or Enable. Disable by Default
AuthMode	WIFI Encryption Method	Click the drop-down box, there are 4 encryption methods for you to choose, of which None means no encryption, any client can directly connect to the WIFI

Key	Other than None encryption, a password is required to connect to this WIFI	You can fill in a password of 8~64 digits
HT Mode	The amount of data that can be transferred at a fixed time	Click the drop-down box to select
Country Region	Compliant with a country's Wi-Fi regulations	Click the drop-down box to select
Channel	Data signal transmission channel from 1 to 13	Click the drop-down box to select

Repeater Setting

Wireless Setting has the Repeater setting option to setup the device to work as WIFI relay that extend WIFI Radio and WIFI coverage.

The screenshot displays the 'LTE Router' web interface. On the left is a dark sidebar with navigation links: Setup-Wizard, Dashboard, Basic, Cellular, Wired, Wi-Fi, DHCP Server, Advanced, and Logout. The main panel is titled 'LTE Router' and shows the 'Repeater' tab selected under the '2.4G' section. The page is titled 'WIFI WISP Repeater' with a subtitle 'We Can configure the wifi wisp for the router'. The configuration area includes:

- Repeater Status:** Disconnected
- Locked BSSID:** Radio buttons for 'Enable' and 'Disable' (Disable is selected).
- SSID:** A text input field.
- BSSID:** A text input field.
- Channel:** A text input field with the value '0'.
- Encryption Mode:** A dropdown menu set to 'Disable'.
- Check Alive Host:** A text input field.

 At the bottom right of the configuration area are two buttons: 'WIFI-SCAN' and 'SAVE & APPLY'.

Common Settings – DHCP Server

In the DHCP server configuration, you can do the IP address and MAC address binding. You can also set the DHCP allocation method. Since the settings on this page may affect the Internet access, it is recommended that to get someone with computer network knowledge to do the setup.

DHCP Static Leases Setting

You can add or del the dhcp static leases in this page

Static Leases

Static leases are used to assign fixed IP addresses and symbolic hostnames to DHCP clients. They are also required for non-dynamic interface configurations where only hosts with a corresponding lease are served.
Use the Add Button to add a new lease entry. The MAC-Address identifies the host, the IPv4-Address specifies to the fixed address to use and the Hostname is assigned as symbolic name to the requesting host.

Advanced Settings

In the advanced settings, you can perform various advanced configurations to the router, such as firewall, port mapping, language setting, time zone, TR069, firmware upgrade, etc.

Advanced Settings – DTU

DTU Management

The screenshot shows the 'LTE Router' interface with a sidebar menu on the left. The 'DTU' option is selected under the 'Advanced' section. The main content area is titled 'DTU Management' and features a 'Servers List' table. The table has columns for Name, Server IP, Server Port, Status, and Actions. One server is listed: 'U2' with IP '10.10.10.100' and port '15000'. The status is '0'. The actions column contains buttons for 'CONNECT', 'STOP', 'EDIT', and 'REMOVE'. An 'ADD' button is located below the table. The top right of the interface shows 'LTE' status, signal strength, and 'English' language.

Name	Server IP	Server Port	Status	Actions
U2	10.10.10.100	15000	0	<button>CONNECT</button> <button>STOP</button> <button>EDIT</button> <button>REMOVE</button>

Serial Port

The screenshot shows the 'LTE Router' interface with the 'Serial Port' option selected under the 'DTU' section. The main content area is titled 'DTU Serial Port Management' and includes a subtitle: 'This is the page of setting the dtu serial port.' Below this is a 'Serial Port Setting' form with the following fields: 'Baud rate' (9600), 'Time Interval(ms)' (100), 'Data bits' (8), 'Parity' (None), and 'Stop bits' (1). A note states: 'Configuring a serial port to accept data timeout.' A 'SAVE & APPLY' button is at the bottom right. The top right of the interface shows 'LTE' status, signal strength, and 'English' language.

Advanced Settings – Firewall

You can set the firewall rules of the router. Since the settings on this page may affect the Internet access, it is recommended that to get someone with computer network knowledge to do the setup.

Firewall - Custom Rules

Custom rules allow you to execute arbitrary iptables commands which are not otherwise covered by the firewall framework. The commands are executed after each firewall restart, right after the default ruleset has been loaded.

This file is interpreted as shell script.
Put your custom iptables rules here, they will
be executed with each firewall (re-)start.

Internal uci firewall chains are flushed and recreated on reload, so
put custom rules into the root chains e.g. INPUT or FORWARD or into the
special user chains, e.g. input_wan_rule or postrouting_lan_rule.
iptables -I zone_wan_forward 2 -p udp -s 0.0.0.0/0 -d 0.0.0.0/0 --dport 500 -j zone_lan_dest_ACCEPT ##vpn_pass_ipsec
iptables -I zone_wan_forward 3 -p esp -s 0.0.0.0/0 -d 0.0.0.0/0 -j zone_lan_dest_ACCEPT ##vpn_pass_ipsec

Backup/Restore

Backup the system configs and restore it and update the firmware

Backup / Restore

Click "Generate archive" to download a tar archive of the current configuration files. To reset the firmware to its initial state, click "Perform reset" (only possible with squashfs images).

Download backup: **GENERATE ARCHIVE**

Reset to defaults: **PERFORM RESET**

To restore configuration files, you can upload a previously generated backup archive here.

Restore backup: 未选择任何文件 **UPLOAD ARCHIVE...**

Flash new firmware image

Upload a sysupgrade-compatible image here to replace the running firmware. Check "Keep settings" to retain the current configuration (please upload the file provided by the manufacturer).

Keep settings: ☒

Image: 未选择任何文件 **FLASH IMAGE...**

Setting	Description	How to Set
Download Backup	Download a tarball of the current configuration	Auto download the backup after clicking GENERATE ARCHIVE
Reset to Defaults	Reset to Factory Configuration	Restore Factory Configuration after clicking PERFORM RESET
Restore Backup	Upload a tarball of the saved configuration and to configure the router parameters to be the same as the saved configuration.	Select a saved configuration file and click UPLOAD ARCHIVE
Keep Settings	This option makes the firmware upgrade will not reset the router parameters, but will keep it instead	Tick or untick
Image (Flash Image)	Upgrade the router firmware	Select the firmware upgrade provided by the manufacturer

Router Password

The screenshot shows the LTE Router web interface. On the left is a dark sidebar with a menu including Setup-Wizard, Dashboard, Basic, Advanced, System (highlighted), IOCTL, Remote Manager, VPN, Static Routes, Diagnostics, SQM QoS, and Logout. The main area has a top navigation bar with tabs: Configuration, Backup/Restore, Router Password (active), Router Model, and Scheduled Reboot. Below the tabs, the title 'Router Password' is followed by the subtitle 'Changes the administrator password for accessing the device'. The form contains two input fields: 'Password' and 'Confirmation', each with a green eye icon for password visibility. A 'SAVE & APPLY' button is at the bottom right.

The router password setting description:

Setting	Description	How to Set
Password	After the modification is completed, the password of the current login account is changed to this password	Fill in the same password in both fields and then apply to make the password change.
Confirmation	Repeat the new password to ensure password you enter correctly	Fill in the same password in both fields and then apply to make the password change.

SAVE & APPLY

Typical Application

Typical Application – APN/VPDN Dedicated Network Card

When the user's card uses a private network card with APN function, the router can be modified according to the following configuration, so that the router can connect to the private network normally.

1. Find the Cellular Network in the basic settings, click "Cellular Setting" tab, fill in the APN or VPDN parameters provided by the operator in the corresponding position, and click "Submit".

The screenshot shows the LTE Router web interface. On the left is a dark sidebar with a menu: Setup-Wizard, Dashboard, Basic, Cellular (highlighted), Wired, Wi-Fi, DHCP Server, Advanced, and Logout. The main content area has a top bar with 'LTE Router' and status icons (LTE, signal strength, English). Below this is a tabbed interface with 'Cellular Information', 'Cellular Setting' (active), 'Band Lock', and 'Network Selection'. The 'Cellular Setting' tab has a sub-header 'Set the params for the Cellular Internet.' and two sub-tabs: 'General Settings' and 'SIM Settings'. The 'General Settings' sub-tab contains a form with the following fields: APN (3GNET@VPDN.GD), PIN (empty), Authentication Type (PAP), PAP/CHAP username (3GNET), and PAP/CHAP password (masked with dots). A green checkmark icon is next to the password field. A 'SAVE & APPLY' button is at the bottom right.

Note: The link detection address must be filled with a server address that can be pinged, otherwise the router cannot judge whether the network dialing is normal or not, which will cause the network to be unstable.

2. Check the network by ping to a server address via the network diagnosis page to determine whether the connection is normal and working.

The screenshot shows the LTE Router web interface with the 'Diagnostics' page selected in the sidebar. The main content area has a top bar with 'LTE Router' and status icons. Below this is a 'Diagnostics' section with a sub-header 'Network Utilities'. It contains three input fields for IP addresses, with the first one containing '114.114.114.114'. Below the input fields are three buttons: 'PING' (selected), 'TRACEROUTE', and 'NSLOOKUP'. Below the buttons is a section titled 'Collecting data...' which displays the results of a ping test to 114.114.114.114. The results show 5 packets transmitted, 5 packets received, 0% packet loss, and a round-trip time of 48.607/60.128/84.450 ms.

Typical Application – WIFI Relay / Repeater

The wireless repeater function is to use the router's WIFI as the wireless client terminal to connect to another existing WIFI hotspot. This solution can use the network of the other router or hotspot to reduce the use of cellular traffic. The specific configuration is as follows:

1. Open the configuration page of "Common Settings" --> "Wireless". Click "Relay Settings", click "Connect" to search for surrounding networks.

LTE Router

2.4G Repeater

WIFI WISP Repeater
